

CVM Administration Manual

Enterprise Customer Visit Management System

PROJECT TYPE	Enterprise Software — Administration & Configuration Manual
ROLE	Sole Technical Writer
SCOPE	300+ page comprehensive system manual
TOOLS	Microsoft Word · Snagit

WHAT I DID

- Served as the sole author of a 300+ page administration and configuration manual for an enterprise-grade customer visit management platform.
- Restructured legacy content into 12 logical, task-oriented chapters — improving navigability for system administrators across global deployments.
- Standardised terminology and definitions across the entire manual to eliminate ambiguity and ensure consistency.
- Simplified complex admin workflows (branch setup, queue configuration, user permissions, digital signage, reporting) into clear, step-by-step procedures.
- Created and maintained the manual through multiple product release cycles, tracking configuration changes and new feature additions.
- Produced supporting visual aids including system diagrams and annotated screenshots.

Result: *Delivered a comprehensive, professionally structured reference guide used by system administrators and IT teams at enterprise client sites worldwide. The restructured chapter layout and standardised terminology significantly reduced configuration errors and support requests.*

The following pages are an excerpt from the manual, covering the Introduction, Manual Structure, Key Definitions, and Core System Concepts. Product and company names have been generalised for public portfolio use.

INTRODUCTION

Welcome

Welcome to the **Customer Visit Management (CVM) Enterprise — Administration and Configuration Guide**. This document provides the essential information needed to effectively set up, manage, and maintain your CVM system.

Overview of the CVM Solution

The **Customer Experience Management (CEM)** solution suite offers innovative technologies designed to deliver a consistent, convenient journey for customers across all points of contact. A key component of this suite is **CVM Enterprise**.

CVM Enterprise is a powerful platform for managing and controlling the entire customer visit cycle within physical locations. From the moment a customer arrives until they depart, the system orchestrates their interaction with self-service or teller-assisted services. It intelligently manages customer flow using first-come, first-served principles or sophisticated priority rules based on customer type, requested service, and other defined attributes.

Beyond queue management, CVM Enterprise provides comprehensive tracking of customer and employee actions. This data fuels insightful reports and dashboards, enabling branch performance management and strategic resource planning. By leveraging automation, CVM aims to streamline operations, reduce customer effort, minimise costs, and enhance both profitability and customer satisfaction.

About This Manual

Purpose: This manual serves as the primary technical reference for administrators responsible for configuring and managing CVM Enterprise.

Audience: System administrators, IT personnel, and designated managers who have the necessary permissions to access and modify CVM settings. A basic understanding of your organisation's operational structure and services is assumed.

Organisation: To improve navigation across this comprehensive guide, content has been restructured into 12 logical chapters, each focusing on a key administrative domain (see structure below).

Manual Structure

Chapter 1	Branch Setup and Management	Creating and managing physical locations and their components.
Chapter 2	Service and Queue Configuration	Setting up services, organising them, and defining queue behaviour.
Chapter 3	User, Role, and Permission Management	Managing system access, user accounts, and permission levels.

Chapter 4	System-Wide Configuration	Global settings affecting the entire CVM environment.
Chapter 5	Customer Identification and Attributes	Configuring methods for identifying customers and managing their data.
Chapter 6	Ticketing Workflow Configuration	Customising the customer's ticketing experience end-to-end.
Chapter 7	Custom Activities	Configuring specific break types and work activity categories.
Chapter 8	Digital Signage Management	Setting up and managing content players and display presentations.
Chapter 9	Advertisement Management	Configuring and targeting advertisements across channels.
Chapter 10	Notifications and Alerts	Setting up technical, queuing, and feedback-related alerts and notification mechanisms.
Chapter 11	Feedback Management	Configuring feedback questions for customers and employees.
Chapter 12	Auditing	Viewing and managing system audit logs.
Appendix	Supplementary Reference	Supported environments, compatibility tables, and a quick-task reference guide.

CHAPTER — DEFINITIONS

Key Terms

The following terms are used throughout this manual with specific, consistent meanings. Familiarity with these definitions is essential before proceeding with system configuration.

Customer	Any person seeking services through the CVM system — for example, a bank client, patient, or citizen visiting a service location.
Service	Any task, transaction, or assistance provided to a Customer by a staff member or automated system — for example, an account inquiry, consultation, or cash deposit.
Branch	A distinct physical location or logical business unit where services are offered — for example, a regional office, retail store, or service centre.

CHAPTER — CORE CONCEPTS

CVM System Architecture

Understanding the fundamental entities and their relationships is essential before configuring CVM. The sections below describe each core concept and how they interact within the system.

Branches, Counters, and Halls

- A **Branch** is the primary location entity — the physical site where customers arrive to receive services.
- Within a branch, **Counters** are the specific service points where staff members interact with customers.
- **Halls** are optional logical groupings used to organise counters within a large branch (for example, separating a ground floor from an upper floor).

Services and Service Groups

- Customers visit a branch to receive one or more **Services** — each representing a distinct type of interaction or transaction.
- **Service Groups** organise related services into logical categories, simplifying both backend management and the customer-facing ticketing interface.

Users and Roles

- **Users** are the employees who interact with the CVM system — whether serving customers at counters, supervising a branch, or administering system-wide settings.
- **Roles** define what each user can see and do. A role bundles a set of **Permissions**, which are then assigned to users based on their job function.

Queues

- CVM manages the flow of waiting customers through **Queues**.
- Queue behaviour is determined by a combination of service priorities, customer segment rules, and configuration settings — enabling both simple first-come-first-served flows and complex, priority-based routing.

Segments

- Customers can be categorised into **Segments** — for example, VIP, Standard, or Premium — typically determined through identification at the point of ticket issuance.
- Segments influence service priority, routing behaviour, or the workflow a customer follows through the system.

Branch and Service Configurations

- **Branch Configurations** store settings that control how a branch operates globally — including general queuing rules, operating behaviour, and default parameters.

- **Service Configurations** hold settings specific to individual services — such as target service times, priority rules, and capacity thresholds.

Calendars

- **Calendars** define the working hours, public holidays, and special closures for branches or individual services.
- Calendar settings control service availability, preventing ticket issuance or counter activation outside defined operational hours.

Instructional Icons

The following icons appear throughout the manual to draw attention to important information:

- **Caution** — indicates a condition that may cause a problem or requires special attention before proceeding.
 - **Cross-reference** — a hyperlink to related information elsewhere in the manual (active in digital formats).
-
